

Clear Aligners

For the alignment of anterior teeth

Clear or invisible aligners have become increasingly popular in recent times. Using contemporary orthodontic techniques, S4S can offer clear aligners for cases that may require simple alignment of anterior teeth.

The aligners are ideal for tipping or minor rotational movements, and can also correct relapsed cases. They are a particularly popular option with adult patients, as it is virtually impossible to see the appliances.

For more difficult cases

Smilelign Clear Aligners can be used to treat more difficult cases. Treatment planning is undertaken using our bespoke 3D digital orthodontic planning software. For more information, visit smilelign.com.

Construction requirements

- Upper and lower impressions
- Bite registration
- Study models should be taken for pre & post treatment records

Rationale

- Small tipping or rotational movements
- Anterior crowding
- Alignment of front teeth prior to veneer placement
